

The website will be a personal blog about my latest and ongoing 3d printing projects, most are model train related. Each post/section will go over a project and the steps it took to get to that point, such as how long it took to print or how long it took to paint. The main audience is other model railroaders, specifically other G scale model railroaders. G scale is a modeling scale that usually ranges between the proportions of 1:22.5 to 1:32. Within this range there are several “micro” scales, such as F gauge which is 1:22.5 and is narrow gauge equipment. I mostly model in 1:29-1:32, depending on the brand and the model I am building. I want to create this website because I love to share my progress on my projects that I am working on. The website will be semi-formal. Each section will go over the steps I took and my thought process through them. The main archetype will be the hero. I want people to be able to learn from this website and take steps to improve their own skills within my hobby. The colors will mostly be shades of gray and green. I chose green because my hobby is mostly done outdoors, with trains running around a garden so it will have lots of floral colors as well. Roboto and Lora will fit well together as my fonts. Roboto gives off that clean and crisp look Google has while Lora is a bit more formal. Some of my website inspirations include other G scale websites such as my G scale club’s website, the Greater Cincinnati Garden Railway Society or GCGRS. (<https://gcgrs.org/>) Another great looking website from one of the people I bought a model from is <https://firstpersonscalemodels.com/> which has a great use of organization.
